I. PROBLEM STATEMENT

If circles $x^2+y^2+2x+2ky+6 = 0$, $x^2+y^2+2ky+k = 0$ intersect orthogonally then find k .

II. CONSTRUCTION

Fig. 1. Orthogonal Circles

Symbol	Value	Description
C1	$\begin{pmatrix} -1 \\ -k \end{pmatrix}$	Center of circle C1
C2	$\begin{pmatrix} 0 \\ -k \end{pmatrix}$	Center of circle C2
P	X	Radius of circle C1
θ	90°	Given that C1 and C2 are Orthogonal
d	1	Distance between centers of the circles

TABLE I
PARAMETERS

Fig. 2. Orthogonal Circles as per our output

III. SOLUTION

Standard form of a circle in matrix form is

$$\mathbf{xVx}^T + 2\mathbf{u}^T\mathbf{x} + f = 0$$

where,

$$\mathbf{V} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}, \text{Center } \mathbf{C} = -\mathbf{V}^{-1}\mathbf{u}^T$$

Equation of given circles can be represented in matrix form as

$$\mathbf{xx}^T + 2 \begin{pmatrix} 1 & k \end{pmatrix} \mathbf{x} + 6 = 0 \quad (1)$$

$$\mathbf{xx}^T + 2 \begin{pmatrix} 0 & k \end{pmatrix} \mathbf{x} + k = 0 \quad (2)$$

where,

$$\mathbf{u}_1 = \begin{pmatrix} 1 \\ k \end{pmatrix}, \mathbf{u}_2 = \begin{pmatrix} 0 \\ k \end{pmatrix}, f_1 = 6, f_2 = k$$

$$\mathbf{C}_1 = \begin{pmatrix} -1 & -k \end{pmatrix}, \mathbf{C}_2 = \begin{pmatrix} 0 & -k \end{pmatrix}$$

Given that, the two circles are orthogonal so tangents at the point of intersection are orthogonal also at the point of intersection tangent of one

circle passes through the center of other circle vice versa.

Let $\mathbf{P} = \mathbf{X}$ be the point of intersection of two circles

So, equation of tangents to the circle which passes through center of other circle can be written for both circles as

$$(-1 \quad -k) \mathbf{X} = 1 + k^2 \quad (3)$$

$$(0 \quad -k) \mathbf{X} = 1 + k^2 \quad (4)$$

By solving eq-3, eq-4 we can obtain the point of intersection of two Circles as

$$\mathbf{X} = \begin{pmatrix} 0 \\ \frac{k^2+1}{k} \end{pmatrix}$$

Also radius vectors of circles at the point of intersection are orthogonal so from figure 1, the angle between the radii r_1 and r_2 is 90° .

From figure $\triangle PC_1C_2$ is a Right angled triangle with hypotenuse $d = \|C_1 - C_2\|$.

So, by using **Pythagoras theorem**

$$\|C_1 - C_2\|^2 = \|C_1 - P\|^2 + \|C_2 - P\|^2 \quad (5)$$

Therefore,

$$1 = 1 + \frac{2k^2 + 1}{k} + 0 + \frac{2k^2 + 1}{k} \quad (6)$$

Yielding, $k = \frac{j}{\sqrt{2}}$ or $\frac{-j}{\sqrt{2}}$

Therefore, the value of k is

$$\mathbf{k} = \frac{j}{\sqrt{2}} \text{ or } \frac{-j}{\sqrt{2}}$$
